

REVOLUTIONARY

"Thanks for inventing something so useful." "★★★★★"
www.RadioShack.com

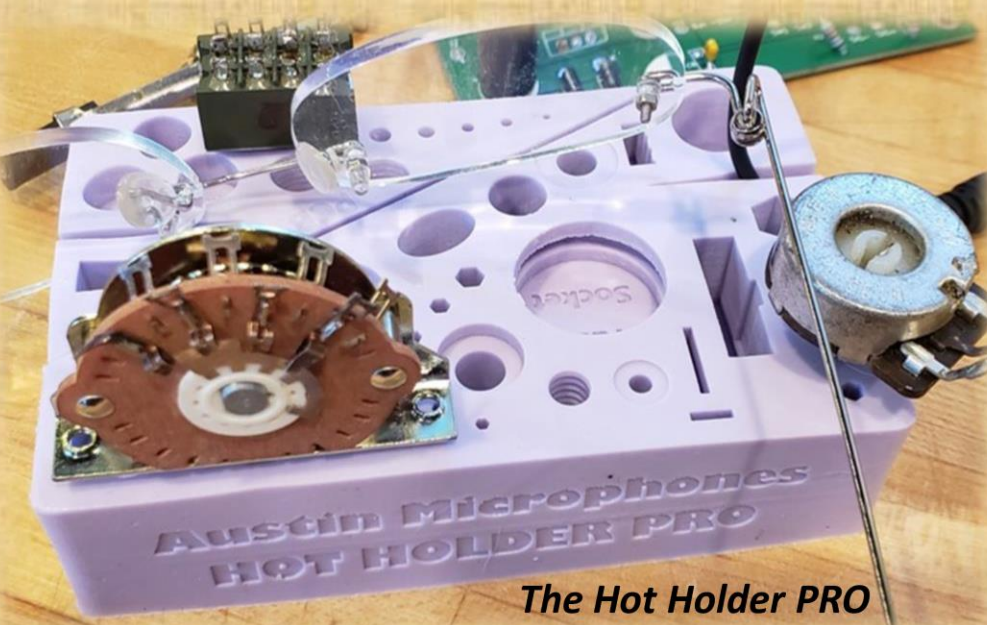

I had to replace 16
XLR connectors.
I LOVE THIS THING!

"Now that I'm familiar with all it can do for me,
I would have gladly paid double the asking price.
And yes you can quote me on that."

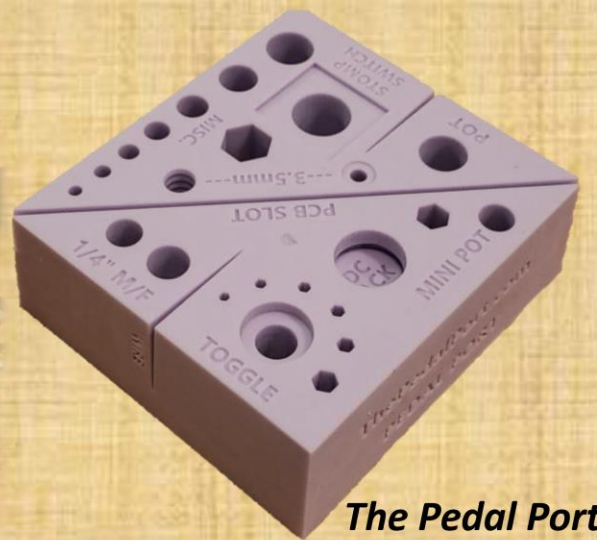

*"Throw away everything with an alligator clip.
This is the best designed soldering tool I've ever used."*

*"This little jewel is now the
center of my workbench."*

"This should be a standard tool in every college Engineering lab."

The Hot Holder PRO

The Pedal Port

Stop burning yourself! Hot Holder products safely grip your work without tipping, scratching, crushing, or sucking the heat out during soldering.

Don't just read the marketing... Trust the professionals:

The ULTIMATE replacement for the 3rd hand... The Hot Holder!

Invented and hand-made in San Diego, CA, *The Hot Holder* products are rock-solid, engineered blocks of soft silicone that embarrass the hell out of those 1970's "3rd hand" things that everyone has, but regrets buying.

Hot Holders are designed for gripping your work perfectly, without scratching, without tipping-over, in any position: PC boards, connectors, wire-tinning etc. And just like a silicone baking pan or trivet, it doesn't conduct heat – It won't suck-out the heat during soldering!!

It's a no-brainer. *You already know how to use it...* ZERO learning curve!!

You're probably already going online to TheHotHolder.com to buy one, but here's some more info so you can tell your colleagues and friends about it:

Unlike those tipsy, "helping hands" alligator-clip things, *a Hot Holder*:

- Has a suction-cup base so it sticks to your work surface.
- Holds Circuit Boards and wires, too!! Use the Circuit board slot, or lay your circuit board on top of it, and it won't slide around while you're soldering.
- Grips parts very tight... But it can't scratch metal, glass or jewelry - It's soft silicone!
- *Is heavy.* Use it in any orientation and press down hard while soldering, and it won't tip-over.
- Won't melt like plastic vise jaws (You know what I'm talking about.)
- Holds wires so you can easily tin them or solder them together. You can even poke component leads into the side to hold them steady.
- Fits almost everything. If you have a connector that doesn't fit one of the engineered voids, just jam it into the one that fits the best. (My daughter uses it for holding odd-shaped rocks and gems to make jewelry.) In no uncertain terms, IT'S AWESOME!
- Is backward-compatible to the 3rd hand: If you really need to use an alligator clip, pull one off your 3rd-hand, and put it into one of the holes, then tip it into position and solder-away!

Admit it... You want one! And now that you've seen it...

If you don't order one right now, the next time you need that alligator-clip "3rd Hand," you'll be wishing you had bought a Hot Holder... I guarantee it.
